Teaching all of the necessary concepts within the constraints of a one-term chemistry course can be challenging. Authors Denise Guinn and Rebecca Brewer have drawn on their 14 years of experience with the one-term course to write a textbook that incorporates biochemistry and organic chemistry throughout each chapter, emphasizes cases related to allied health, and provides students with the practical quantitative skills they will need in their professional lives. Essentials of General, Organic, and Biochemistry captures student interest from day one, with a focus on attention-getting applications relevant to health care professionals and as much pertinent chemistry as is reasonably possible in a one term course. Students value their experience with chemistry,

getting a true sense of just how relevant it is to their chosen profession. Abstract: We present a prediction model for linear free energy relationship (LFER) descriptors - excess molar refraction (E), dipolarity/polarizability (S), hydrogen bonding acidity (A) & basicity (B), McGowan volume (V), and interaction of cations (J(+)) and anions (J(-)) - of both ionic and neutral compounds at the same scale. From computational calculations using density functional theory, a conductor screening model, and the OBPROP program in Turbomole, we obtained the following physicochemical sub-parameters for 992 molecules and atoms, polar surface area, molecular weight, volume, energy of van der Waals, sigma moments, molar refraction, and hydrogen-bond donor and acceptor abilities of a molecule or an atom. By making selective combinations of these sub-parameters - including also the number of rings, OH groups, and hydrogen atoms attached to nitrogen - we obtained prediction models for the LFER descriptors V, E, S, A, and B with reasonable accuracies, i.e. for a training set of compounds all R-2 above 0.934. We validated the models by comparing calculated and experimentally determined LFER descriptors of a test set. Using the complete dataset, the following R-2 and SE values were obtained: E (R-2 = 0.949, SE = 0.136), S (R-2 = 0.940, SE = 0.378), A (R-2 = 0.936, SE = 0.148), B (R-2 = 0.973, SE = 0.160), J(+) (R-2 = 0.816, SE = 0.351), and J(-) (R-2 = 0.700, SE = 0.291). Furthermore, we demonstrated the applicability of the calculated LFER descriptors by predicting transfers of neutral and ionic compounds from water to propylene carbonate, sulfolane, and ethylene glycol with good accuracy. These results show that physicochemical properties of ionic and neutral compounds can be reliably predicted with identical LFER descriptors even for chemical entities that do not yet exist Ebook: Introductory Chemistry: An Atoms First Approach The fifth edition of this engaging and established textbook provides students with a complete course in chemical literacy and assumes minimal prior experience of science and maths. Written in an accessible and succinct style, this book offers comprehensive coverage of all the core topics in organic, inorganic and physical chemistry. This is a great reference for those interested in the chemical and crystallographic properties of minerals. Steve and

Susan Zumdahl's texts focus on helping students build critical thinking skills through the process of becoming independent problem-solvers. They help students learn to think like a chemists so they can apply the problem solving process to all aspects of their lives. In CHEMISTRY: AN ATOMS FIRST APPROACH, the Zumdahls use a meaningful approach that begins with the atom and proceeds through the concept of molecules, structure, and bonding, to more complex materials and their properties. Because this approach differs from what most students have experienced in high school courses, it encourages them to focus on conceptual learning early in the course, rather than relying on memorization and a plug and chug method of problem solving that even the best students can fall back on when confronted with familiar material. The atoms first organization provides an opportunity for students to use the tools of critical thinkers: to ask questions, to apply rules and models and to evaluate outcomes. Designed to help all students to learn chemistry, Living by Chemistry is a full-year high school curriculum that incorporates science practices with a guided-inquiry approach. Students of all levels will gain a deep understanding of chemistry with this program. With Living by Chemistry, students learn chemistry in the same way that chemists work by asking questions, collecting evidence, and thinking like scientists. Living by Chemistry is the product of a decade of research and development in high school classrooms, focusing on optimizing student understanding of chemical principles. Author Angelica Stacy assisted in the development of the NGSS standards and served on the AP Chemistry redesign committee. She designed Living by Chemistry as an introduction for students who will take AP Chemistry or additional college classes. The curriculum was developed with the belief that science is best learned through first-hand experience and discussion with peers. Guided inquiry allows students to actively participate in, and become adept at, scientific processes and communication. These skills are vital to a students further success in science as well as beneficial to other pursuits. Formal definitions and formulas are frequently introduced after students have explored, scrutinized, and developed a concept, providing more effective instruction. LBCs innovative curriculum offers much more than traditional programs. To help engage students of all levels, the curriculum provides a variety of learning experiences through activities, discussions, games, demos, lectures, labs, and individual work. This workbook is a comprehensive collection of solved exercises and problems typical to AP, introductory, and general chemistry courses, as well as blank worksheets containing further practice problems and questions. It contains a total of 197 learning objectives, grouped in 28 lessons, and covering the vast majority of the types of problems that a student will encounter in a typical one-year chemistry course. It also contains a fully solved, 50-question practice test, which gives students a good idea of what they might expect on an actual final exam covering the entire material.
