Nonlinear Hyperbolic Equations – Theory, Computation Methods, and Applications Mar 19 2022 On the occasion of the International Conference on Nonlinear Hyperbolic Problems held in St. Etienne, France, 1986 it was decided to start a two years cycle of conferences on this very rapidly expanding branch of mathematics and its applications in Continuum Mechanics and Aerodynamics. The second conference took place in Aachen, FRG, March 14-18, 1988. The number of more than 200 participants from more than 20 countries all over the world and about 100 invited and contributed papers, well balanced between theory, numerical analysis and applications, do not leave any doubt that it was the right decision to start this cycle of conferences, of which the third will be organized in Sweden in 1990. This volume contains sixty eight original papers presented at the conference, twenty two of them dealing with the mathematical theory, e.g. existence, uniqueness, stability, behaviour of solutions, physical modelling by evolution equations. Twenty two articles in numerical analysis are concerned with stability and convergence to the physically relevant solutions such as schemes especially devised for treating shocks, contact discontinuities and artificial boundaries. Twenty four papers contain multidimensional computational applications to nonlinear waves in solids, flow through porous media and compressible fluid flow including shocks, real gas effects, multiphase phenomena, chemical reactions etc. The editors and organizers of the Second International Conference on Hyperbolic Problems would like to thank the Scientific Committee for the generous support of recommending invited lectures and selecting the contributed papers of the conference.

The Solution of Choice Mar 31 2023 Is the goal to manage character or change it? Nearly five hundred years ago, the church made a sharp left turn in response to the Enlightenment. This shift created a skewed paradigm that has left the church offering solutions for character change that have not worked. There are far too many Christians living as if real character change will only happen on the other side of eternity. But what if Christ-likeness was meant to be a reality in this life? Is it really necessary for so many Christians to feel like the best they can do is hold on until they die? In this book we will see how four great Enlightenment ideas have neutralized the church and how something we all know but rarely understand can bring us transformed lives.

Riemann Solvers and Numerical Methods for Fluid Dynamics Jun 21 2022 In 1917, the British scientist L. F. Richardson made the first reported attempt to predict the weather by solving partial differential equations numerically, by hand! It is generally accepted that Richardson's work, though unsuccessful, marked the beginning of Computational Fluid Dynamics (CFD), a large branch of Scientific Computing today. His work had the four distinguishing characteristics of CFD: a PRACTICAL PROBLEM to solve, a MATHEMATICAL MODEL to represent the problem in the form of a set of partial differential equations, a NUMERICAL METHOD and a COMPUTER, human beings in Richardson's case. Eighty years on and these four elements remain the pillars of modern CFD. It is therefore not surprising that the generally accepted definition of CFD as the science of computing numerical solutions to Partial Differential or Integral Equations that are models for fluid flow phenomena, closely embodies Richardson's work. COMPUTERS have, since Richardson's era, developed to unprecedented levels and at an ever decreasing cost. PRACTICAL PROBLEMS to solved numerically have increased dramatically. In addition to the traditional demands from Meteorology, Oceanography, some branches of Physics and from a range of Engineering Disciplines, there are at present fresh demands from a dynamic and fast-moving manufacturing industry, whose traditional build-test-fix approach is rapidly being replaced by the use of quantitative methods, at all levels. The need for new materials and for decision-making under environmental constraints are increasing sources of demands for mathematical modelling, numerical algorithms and high-performance computing.

China's Leftover Women Oct 02 2020 The term "sheng nu" ("leftover women") has been recently coined in China to describe the increasing number of women, especially highly educated professional women in their late twenties and over who have not married. This book explores this phenomenon, reporting on extensive research among "leftover women", research which reveals that the majority of women are keen to get married, contrary to the notion that traditional marriage has lost its appeal among the new generations of economically independent women. The book explains the reasons behind these women's failures to get married, discusses the consequences for the future make-up of China's population at the dawn of its modification of the one child policy, and compares the situation in China with that in other countries. The book provides practical solutions for educated women's courtship dilemmas, and long term solutions for China's partnering issues, gender relations, and marriage formation. The book also relates the 'leftover women' problem to theories of family, mate selection, feminism, and individualization.

Stable Solutions to the Social Choice Problem Jul 31 2020 Social Choice problem is defined for a finite set of alternatives A , over which a finite number of agents have preferences. Solution to the problem is a rule determining alternatives, which are the "best" to the group. The Condorcet winner is regarded as the best choice but it is absent in general case. Attempts were made to extend the set of chosen alternatives up to a certain always non-empty subset of A , defined through majority relation. Being different incarnations of an idea of optimal choice this solutions enable one to compare and evaluate social choice procedures. And when there is a connection of a solution set with a particular voting game, it enables one to make predictions with respect to choice results. Here for such class of majority relation as tournaments three solutions are considered: the uncovered set, the minimal weakly stable set and the minimal dominant set (top cycle). A criterion to determine whether an alternative belongs to a minimal weakly stable set is found. It relates the minimal weakly stable set to the uncovered set. The idea of stability is employed to generalize the notions of weakly stable and uncovered sets. Concepts of k -stable alternatives and k -stable sets are introduced and their mutual relations are explored. A concept of the minimal dominant set is generalized. It is shown that the classes of k -stable alternatives and k -stable sets and dominant sets constitute a system of reference based on difference in degrees of stability.
